ESP8266 - AT Command Reference

26 Mar 2015 | by fuho

ESP8266, in it's default configuration, boots up into the serial modem mode. In this mode you can communicate with it using a set of **AT commands**. I will present to you a reference of all known AT commands that ESP8266 supports, explain what they do and how to use them.

Historically AT commands are based on the Hayes Command Set and these are no different.

AT Commands

Index of all known AT commands

Basic	WiFI layer	TCPIP Layer
AT	AT+CWMODE	AT+CIPSTATUS
AT+RST	AT+CWJAP	AT+CIPSTART
AT+GMR	AT+CWLAP	AT+CIPSEND
AT+GSLP	AT+CWQAP	AT+CIPCLOSE
ATE	AT+CWSAP	AT+CIFSR
	AT+CWLIF	AT+CIPMUX
	AT+CWDHCP	AT+CIPSERVER
	AT+CIPSTAMAC	AT+CIPMODE
	AT+CIPAPMAC	AT+CIPSTO
	AT+CIPSTA	AT+CIUPDATE
	AT+CIPAP	+IPD

Line termination

Command variants

Type	Example	Description
Test	AT+CIPSTART=?	Query the range of values (So far only AT+CWMODE=? uses it)
Query	AT+CMD?	Returns the current value of the parameter.
Set	AT+CMD=Parameter	Set the value of user-defined parameters in commands and run.
Execute	AT+CMD	Runs commands with no user-defined parameters.

Note:

- Not all AT commands support all 4 variants.
- [] = default value, not required or may not appear.
- String values require double quotation marks, for example: AT+CWSAP="ESP756190", "21030826", 1, 4.
- Baud rate = 115200
- AT instruction ends with "\r\n"

Officients a Charlement of Responsible Serve training to the contract of the c

AT - Test AT startup

Variant	Command	Response	Function
Execute	AT	OK	Test if AT system works correctly

Back to Index

AT+RST - Restart module

Variant	Command	Response	Function
Execute	AT+RST	OK	Reset the module

ESP-01 Output after reset:

```
ets Jan 8 2013,rst cause:4, boot mode:(3,7)

wdt reset
load 0x40100000, len 24444, room 16
tail 12
chksum 0xe0
ho 0 tail 12 room 4
load 0x3ffe8000, len 3168, room 12
tail 4
chksum 0x93
load 0x3ffe8c60, len 4956, room 4
tail 8
chksum 0xbd
csum 0xbd
```

ESP-12 Output after reset:

```
\0x04B1\0x85 \0xff\0x13:'\0xe0;\0xcc;!G\0xfa\0x11\0xa9R\0xc6\0x83\0x01\0xd9\0x81
[Vendor:www.ai-thinker.com Version:0.9.2.4]
ready
```

Back to Index

AT+GMR - View version info

Variant	Command	Response	Function
Execute	AT+GMR	version, OK	Print firmware version

Parameters:

• version : firmware version number

ESP-01 output:

00160901

ESP-12 output:

0018000902-AI03

Mariant. P Community Cresponsies (Responsies of Euroction Function				n
Variant	Command	Response	Function	
set	AT+GSLP= time	time OK	Enter deep sleep mode for time milliseconds	

• time: Time to sleep in milliseconds

Example:

AT+GSLP=1500

Note:

Hardware has to support deep-sleep wake up (Reset pin has to be High).

Back to Index

ATE - Enable / Disable echo

Variant	Command	Response	Function
Execute	ATE0	OK	Disable echo (Doesn't send back received command)
Execute	ATE1	OK	Enable echo (Sends back received command before response)

Note:

I haven't had any luck with this command yet. Both $\,$ ATE0 $\,$ and $\,$ ATE1 return $\,$ no this fun . ATE returns $\,$ OK

This changed with ESP-12 where the command functions exactly as expected!

Back to Index

AT+CWMODE - WIFI mode (station, AP, station + AP)

Variant	Command	Response	Function
Test	AT+CWMODE=?	+CWMODE:(1-3) OK	List valid modes
Query	AT+CWMODE?	+CWMODE: mode OK	Query AP's info which is connect by ESP8266.
Execute	AT+CWMODE= mode	OK	Set AP's info which will be connect by ESP8266.

Parameters:

- mode : An integer designating the mode of operation either 1, 2, or 3.
 - 1 = Station mode (client)
 - 2 = AP mode (host)
 - 3 = AP + Station mode (Yes, ESP8266 has a dual mode!)

Notes:

ESP-12 came configured as **host** with ssid set to *ESP_A0A3F2*, no password, channel *1* You can use AT+CWSAP? to find the current settings.

Response Function Funct

AT+CWJAP - Connect to AP

Variant	Command	Response	Function
Query	AT+CWJAP?	+ CWJAP: ssid OK	Prints the SSID of Access Point ESP8266 is connected to.
Execute	AT+CWJAP= ssid , pwd	OK	Commands ESP8266 to connect a SSID with supplied password.

Parameters:

• ssid : String, AP's SSID

• pwd : String, not longer than 64 characters

Example:

```
AT+CWJAP="my-test-wifi","1234test"
```

Example AT+CWJAP? :

```
+CWJAP:"my-test-wifi"
```

Back to Index

AT+CWLAP - Lists available APs

Variant	Command	Response	Function
Set	AT+CWLAP= ssid , mac , ch	+CWLAP: ecn , ssid , rssi , mac OK	Search available APs with specific conditions.
Execute	AT+CWLAP	AT+CWLAP: ecn , ssid , rssi , mac OK	Lists available Access Points.

Parameters:

• ecn:

• **0** = OPEN

• **1** = WEP

• **2** = WPA_PSK

• **3** = WPA2_PSK

• **4** = WPA_WPA2_PSK

• ssid: String, SSID of AP

• rssi: signal strength

• mac : String, MAC address

Note:

Over FSR 01 chave had no lecks with stee set we from Respises mand (AT+CWLAP=...). If you know, what it does please let me know.

On **ESP-12**, the *Set* version of the command allows to see if a certain SSID, with certain MAC on certain channel exists. If it doesit is returned as one line of the *Execute* version of this command.

Example AT+CWLAP:

```
+CWLAP: (3, "CVBJB", -71, "f8:e4:fb:5b:a9:5a", 1)
+CWLAP: (3,"HT 00d02d638ac3",-90,"04:f0:21:0f:1f:61",1)
+CWLAP: (3, "CLDRM", -69, "22:c9:d0:1a:f6:54",1)
+CWLAP: (2, "AllSaints", -88, "c4:01:7c:3b:08:48",1)
+CWLAP: (0, "AllSaints-Guest", -83, "c4:01:7c:7b:08:48", 1)
+CWLAP: (0, "AllSaints-Guest", -83, "c4:01:7c:7b:05:08", 6)
+CWLAP: (4, "C7FU24", -27, "e8:94:f6:90:f9:d7",6)
+CWLAP: (2, "AllSaints", -82, "c4:01:7c:3b:05:08", 6)
+CWLAP: (3, "QGJTL", -87, "f8:e4:fb:b5:6b:b4",6)
+CWLAP: (4, "50EFA8", -78, "74:44:01:50:ef:a7",6)
+CWLAP: (0, "optimumwifi", -78, "76:44:01:50:ef:a8", 6)
+CWLAP: (3, "BHQH4", -95, "18:1b:eb:1a:af:5b", 6)
+CWLAP: (3, "NETGEAR49", -86, "84:1b:5e:e0:28:03", 7)
+CWLAP: (3, "ngHub 319332NW00047", -56, "20:e5:2a:79:b1:2f",11)
+CWLAP: (3, "BFZR4", -73, "18:1b:eb:1d:c3:91", 11)
+CWLAP: (1, "5FFVL", -82, "00:26:b8:b5:c0:f2", 11)
+CWLAP: (3, "59G6D", -77, "00:7f:28:6d:91:7b",11)
+CWLAP: (3, "N16FU", -53, "20:cf:30:ce:60:fe", 11)
+CWLAP: (3, "ITS", -82, "90:72:40:21:5f:76",11)
+CWLAP: (3, "ITS", -79, "24:a2:e1:f0:04:e4",11)
```

Example AT+CWLAP="N16FU","20:cf:30:ce:60:fe",11:

```
+CWLAP: (3, "N16FU", -53, "20:cf:30:ce:60:fe", 11)
```

AT+CWQAP - Disconnect from AP

Variant	Command	Response	Function
Execute	AT+CWQAP	OK	Disconnect ESP8266 from the AP is currently connected to.

Note:

After running this command, if you run AT+CWJAP? it still shows the AP you were connected to before. Back to Index

AT+CWSAP - Configuration of softAP mode

Variant	Command	Response	Function
Query	AT+CWSAP?	+CWSAP: ssid , pwd , ch , ecn OK	Query configuration of ESP8266 softAP mode.
Set	AT+CWSAP= ssid , pwd , ch , ecn	OK	Set configuration of softAP mode.

Parameters:

- ssid: String, ESP8266's softAP SSID
- pwd: String, Password, no longer than 64 characters
- ch : channel id
- ecn:
 - 0 = OPEN

```
Variant

Command SK
Response
3 = WPA2_PSK

4 = WPA_WPA2_PSK
```

Example

```
AT+CWSAP="esp_123","1234test",5,3
AT+CWSAP? => +CWSAP:"esp_123","1234test",5,3
```

Back to Index

AT+CWLIF - List clients connected to ESP8266 softAP

Variant	Command	Response	Function
Execute	AT+CWLIF	[ip,other]OK	List information on of connected clients.

Parameters:

ip: IP address of a client connected to the ESP8266 softAP other: Other info, look at example. I don't know what it means yet.

Example (ESP-01):

```
AT+CWLIF

192.168.4.100,3fff50b4:3fff50ba:3fff50c0:3fff50c6:3fff50cc:3fff50d2

OK
```

Example (ESP-12):

```
AT+CWLIF

192.168.4.100,c0:ee:fb:25:33:ec

OK
```

I ran the command after connecting to the ESP8266 with my cellphone.

Back to Index

AT+CWDHCP - Enable/Disable DHCP

Variant	Command	Response	Function
Set	AT+CWDHCP= mode, en	ОК	Enable or disable DHCP for selected mode

Parameters:

mode :

0 : set ESP8266 as a softAP1 : set ESP8266 as a station

• 2 : set both ESP8266 to both softAP and a station

• en:

0 : Enable DHCP1 : Disable DHCP

Note:

This command doesn't seem to work on firmware 00160901 (ESP-01) nor 0018000902-AI03 (ESP-12).

Wariants: Commandet MAResphissonse Estriction **Variant** Command **Function** Response Print current +CIPSTAMAC: mac OK Query AT+CIPSTAMAC? MAC ESP8266's address. Set ESP8266's AT+CIPSTAMAC= mac OK Execute MAC address.

Parameters:

• mac : String, MAC address of the ESP8266 station.

Example:

AT+CIPSTAMAC="18:aa:35:97:d4:7b"

Note:

This command doesn't seem to work on firmware 00160901

Back to Index

AT+CIPAPMAC - Set MAC address of ESP8266 softAP

Variant	Command	Response	Function
Query	AT+CIPAPMAC?	+CIPAPMAC: mac OK	Get MAC address of ESP8266 softAP.
Execute	AT+CIPAPMAC= mac	ОК	Set mac of ESP8266 softAP.

Parameters:

• mac : String, MAC address of the ESP8266 softAP.

Example:

AT+CIPAPMAC="2c:aa:35:97:d4:7b"

Note:

This command doesn't seem to work on firmware 00160901

Back to Index

AT+CIPSTA - Set IP address of ESP8266 station

Variant	Command	Response	Function
Query	AT+CIPSTA?	+CIPSTA: ip OK	Get IP address of ESP8266 station.
Execute	AT+CIPSTA= ip	ОК	Set ip addr of ESP8266 station.

Parameters:

• ip : String, ip address of the ESP8266 station.

Evanue: Command Regespease Function Function

AT+CIPSTA="192.168.101.108"

Note:

This command doesn't seem to work on firmware 00160901

Back to Index

AT+CIPAP - Set ip address of ESP8266 softAP

Variant	Command	Response	Function
Query	AT+CIPAP?	+CIPAP: ip OK	Get ip address of ESP8266 softAP.
Execute	AT+CIPAP= ip	OK	Set ip addr of ESP8266 softAP.

Parameters:

ip: String, ip address of ESP8266 softAP.

Example:

```
AT+CIPAP="192.168.5.1"
```

Note:

This command doesn't seem to work on firmware 00160901

Back to Index

AT+CIPSTATUS - Information about connection

Variant	Command	Response	Function
Test	AT+CIPSTATUS=?	OK	
Execute	AT+CIPSTATUS	STATUS: status +CIPSTATUS: id , type , addr , port , tetype OK	Get information about connection.

Parameters:

- status :
 - 2: Got IP
 - o 3: Connected
 - o 4: Disconnected
- id : id of the connection (0~4), for multi-connect
- type : String, "TCP" or "UDP"
- addr : String, IP address.
- port : port number
- tetype :
 - 0 = ESP8266 runs as a client
 - 1 = ESP8266 runs as a server

Note:

On **ESP-01** this command returns STATUS:1 instead (no extra info, but status changes) On **0018000902-AI03** this command returns STATUS:2 instead (no extra info, but status changes)

AT+CIPSTART - Establish TCP connection or register UDP port and start a connection

Variant Command	Response	Function	
-----------------	----------	----------	--

Varia	nt	Command	Respor	nse	Function	
Set	АТ	+CIPSTART= type , addr , por	t	OK		Start a connection as client. (Single connection mode)
Set	АТ	+CIPSTART= id , type , addr	, port	OK		Start a connection as client. (Multiple connection mode)
Test	AT	+CIPSTART=?		(id) ("ip ado	ciPSTART: ("type"), dress"), rt)] OK	List possible command variations)

id: 0-4, id of connection
type: String, "TCP" or "UDP"
addr: String, remote IP
port: String, remote port

Back to Index

AT+CIPSEND - Send data

Variant	Command	Response	Function
Test	AT+CIPSEND=?	OK	
Set	AT+CIPSEND= length	SEND OK	Set length of the data that will be sent. For normal send (single connection).
Set	AT+CIPSEND= id , length	SEND OK	Set length of the data that will be sent. For normal send (multiple connection).
Execute	AT+CIPSEND		Send data. For unvarnished transmission mode.

Normal Mode

Parameters:

• id: ID no. of transmit connection

• length: data length, MAX 2048 bytes

Unvarnished Transmission Mode

Wrap return ">" after execute command. Enters unvarnished transmission, 20ms interval between each packet, maximum 2048 bytes per packet. When single packet containing "+++" is received, it returns to command mode.

Nariant	Mariante Commended OS CRESportesponse Crimination in Commended Com					
Variant	Command	Response	Function			
Test	AT+CIPCLOSE=?	OK				
Set	AT+CIPCLOSE= id	OK	Close TCP or UDP connection.For multiply connection mode			
Execute	AT+CIPCLOSE	OK	Close TCP or UDP connection.For single connection mode			

• id : ID no. of connection to close, when id=5, all connections will be closed.

Note:

In server mode, id = 5 has no effect!

Back to Index

AT+CIFSR - Get local IP address

Variant	Command	Response	Function
Test	AT+CIFSR=?	OK	
Execute	AT+CIFSR	+CIFSR: ip OK	Get local IP address.

Parameters:

• ip: IP address of the ESP8266 as an client.

Example AT+CIFSR:

10.101.10.134

Back to Index

AT+CIPMUX - Enable multiple connections or not

Variant	Command	Response	Function
Set	AT+CIPMUX= mode	OK	Enable / disable multiplex mode (up to 4 conenctions)
Query	AT+CIPMUX?	+CIPMUX: mode OK	Print current multiplex mode.

Parameters:

- mode:
 - **0**: Single connection
 - 1: Multiple connections (MAX 4)

NOTE:

This mode can only be changed after all connections are disconnected. If server is started, reboot is required.

Mariant's Commend Configes Responses eResponsection untion			
Variant	Command	Response	Function
Set	AT+CIPSERVER= mode [, port]	OK	Configure ESP8266 as server

- mode:
- 0: Delete server (need to follow by restart)
- 1: Create server
- port : port number, default is 333

NOTE:

- 1. Server can only be created when AT+CIPMUX=1
- 2. Server monitor will automatically be created when Server is created.
- 3. When a client is connected to the server, it will take up one connection, be gave an id.

Back to Index

AT+CIPMODE - Set transfer mode

Variant	Command	Response	Function
Query	AT+CIPMODE?	+CIPMODE: mode OK	Set transfer mode,normal or transparent transmission.
Set	AT+CIPMODE= mode	ОК	Set transfer mode,normal or transparent transmission.

Parameters:

- mode :
- 0: normal mode
- 1: unvarnished transmission mode

Back to Index

AT+CIPSTO - Set server timeout

Variant	Command	Response	Function
Query	AT+CIPSTO?	+CIPSTO: time	Query server timeout.
Set	AT+CIPSTO= time	OK	Set server timeout.

Parameters:

• time: server timeout, range 0~7200 seconds

Back to Index

AT+CIUPDATE - update through network

!!! Don't run this unless you know what you're doing !!!

!!! It will likely brick your device !!! Attempts to self-update from the internet.

Variant	Command	Response	Function
---------	---------	----------	----------

Variant	Command	Res Respe nse	Fulfructiction
Execute	AT+CIUPDAT	E +CIPUPDATE: n OK	Start update through network

- n :
- 1: found server
- 2: connect server
- 3: got edition
- 4: start update

Example:

Back to Index

+IPD - Receive network data

Variant	Command	Response	Function
Execute		+IPD, len : data	Receive network data from single connection.
Execute		+IPD, id , len : data	Receive network data from multiple connection.

Parameters:

• id: id no. of connection

len: data lengthdata: data received

Note:

I have had no luck with this command so far.
